Computer users are increasingly connecting to the web over wireless networks and as a result, a steady stream of malware is being passed back and forth. This malicious code, called malvertising or malvertising, or any similar term and known as Cross-Site Scripting (XSS) exploits, can be used for malicious purposes such as advertising malware, distributing spyware or ransomware and even site defacement. Lastly, malware can be disguised as a normal browser add-on, such as a search plug-in, a chat extension, or a social sharing extension, which is one of the most recent methods that has emerged.

**How to avoid Malvertising:** While any method of getting malware to your computer is possible, the most effective way to avoid it is to block the Internet. Whenever you have the option, download all of the software you require directly from the official websites, which is a much less likely,
